Abstract

The invention pertains to a vehicle comprising an electric machine-motor serving as a powering engine and a storage battery for running the electric motor. The vehicle comprises means (18, 50) for charging the battery with a charger coupled to an electric power source external to the vehicle with power for rapid charge, for example, on the order of magnitude of ten minutes. The battery charging means are a charger is, for example, designed to enable a charge via a three-phase power supply network, in particular, 380 V.
